

Cloud Based Temperature , Humidity Reading and Location Tracking

Kevin Joe Ronin

Project Components:-

This project consists of two parts

1)Hardware Part

2)Software Part

1) Hardware Part

Raspberry Pi,DHT11 sensor and a Mobile phone.

Through the Raspberry pi,the values of the DHT 11 Sensor is been sent to the IBM Watson Cloud Platform.The values are then taken to the node red and a UI is been created using the node red. Have also created a UI in the IBM watson for the purpose to check wheather the value is been read or not

The Location is been tracked using the Webhooks Relay and Owntracks. The GPS value from the mobile phone is sent to the Webhooks Bucket and from there the value is been sent to the node red dashboard. A Geofencing is also been created so that if the package/in case if something goes out of the respected boundry a trigger will be generated.

2)Software Part

Thonny(Python 3.7) :- Python code to get value from the DHT 11 Sensor and send to the IBM IoT Platform and also to Enable the trigger Light if temperature Exceeds a limit.

IBM Watson IoT Platform:- To Store the data from the DHT11 Sensor

Node Red:- To Create a UI from the data from the DHT 11 sensor and Webhooks, To trigger Warnings if temperature exceeds a limit or the object is outside the geofence.

Webhooks:- To Store the Location data from the Owntracks

Owntracks:- Gets the Location value from our Mobile

Source Code:-

```
import RPi.GPIO as GPIO

import dht11

import time

import sys

import ibmiotf.application

import ibmiotf.device

import random
```

deviceCli.disconnect()
```

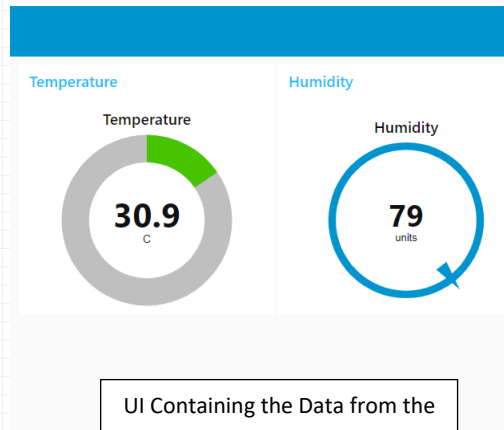

Screenshots:-

Cloud Based Temperature , Humidity Reading and Location Tracking

The Flow nodes in the Node Red

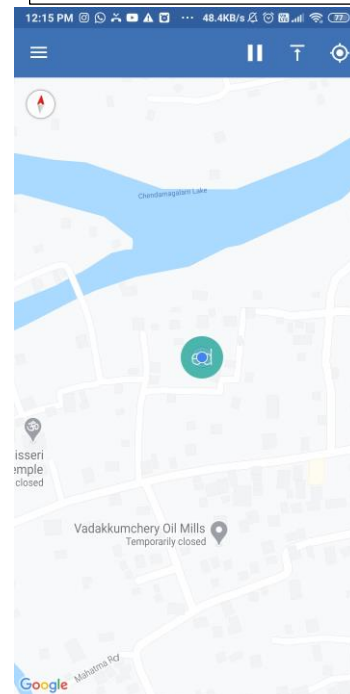

UI Containing the Data from the DHT11 Sensor

The screenshot shows the 'Webhook Relay' interface with a table of 'Relay Logs'. The table lists incoming requests with columns for Request ID, Received At, Method, Input, Output, Status, and Response Status.

Request ID	Received At	Method	Input	Output	Status	Response Status
May 200 2020 12:14:08	2020/05/24	POST	Default public endpoint	[not found]	sent	200
May 200 2020 9:24:21	2020/05/24	POST	Default public endpoint	[not found]	sent	200
May 200 2020 9:23:28	2020/05/24	POST	Default public endpoint	[not found]	sent	200

Webhooks Relay Bucket Containing location data

Owntracks Mobile App

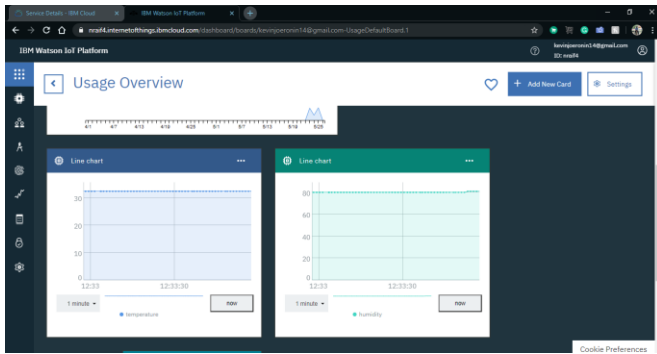

The Location been Displayed in Node Red UI, Which shows the marking location of device

The screenshot shows the 'IBM Watson IoT Platform' interface. It displays a table of 'Recent Events' with columns for Event, Value, Format, and Last Received.

Event	Value	Format	Last Received
Data	["t": "temperature", "h": "humidity"]	json	a few seconds ago
Data	["t": "temperature", "h": "humidity"]	json	a few seconds ago
Data	["t": "temperature", "h": "humidity"]	json	a few seconds ago
Data	["t": "temperature", "h": "humidity"]	json	a few seconds ago
Data	["t": "temperature", "h": "humidity"]	json	a few seconds ago
